Thoma, Christine A

MRN: 2617389

Office Visit 5/6/2026
Salem Health Medical Clinic - Independence

Provider: Placek, Mary Susanne, MD (Family Medicine)
Primary diagnosis: Routine general medical examination at a health care facility
Reason for Visit: PHYSICAL

Progress Notes

Placek, Mary Susanne, MD (Physician) • Family Medicine

CC: Well woman examination

HPI: Christine is a 42 y.o.-year-old female who presents for annual routine checkup.
Patient's last menstrual period was 04/18/2026 (exact date).

History of Present Illness

A female with bilateral knee pain and crepitus associated with increased gym activity, menstrual cycle changes, neck pain related to muscle strain, and a history of mole removals seen for a physical exam.

Over the past year and a half, she has increased her gym attendance, which she associates with ongoing bilateral knee issues. She describes her knees as "creaky," a sensation present since her early 20s, with crunching noises when ascending stairs. Squats and lunges have consistently been difficult. Recent gym routines have led to sensations of tight quadriceps with pulling, as well as a deep, achy pain, especially when descending stairs. The discomfort varies, sometimes causing her to avoid weight-bearing. She previously received care at Northwest Rehab Associates and found it helpful.

For the past two years, she has noticed changes in her menstrual cycle, including a shortened interval between periods. While her cycles remain regular, she now experiences premenstrual symptoms such as emotional changes and occasional hot flashes, typically about a week before her period. These symptoms were more pronounced last fall but have since lessened. She is not currently using birth control or other medications, though she takes supplements. She is interested in a baseline ovarian evaluation due to a family history of ovarian cancer in her grandmother, who died over age 60.

She has a history of two moles removed from her back and currently has a mole on her neck that was not previously removed due to its proximity to her face. She would like to have this mole removed.

She reports neck pain attributed to irritation of the trapezius muscles from gym activities, with discomfort radiating to the base of her head. She has seen a chiropractor and has upcoming appointments for massage therapy and acupuncture, believing the issue is muscular.

She reports a job change since her last visit and currently describes her work as the least stressful in her life. In 10/2025, she experienced an 8-week illness with a cough.

GYNECOLOGICAL HISTORY:
- Cycle length: Shortened
- Frequency and flow: Regular
- Menstrual pain: Present

PAST SURGICAL HISTORY:
Removal of 2 moles on the back

FAMILY HISTORY
Her grandmother died from ovarian cancer over the age of 60. Her father may have had skin cancer, but it did not require major surgeries or chemotherapy.
